Universität Karlsruhe, Germany

# Main Problem

*Characterize the non-local properties of quantum states.*

## Various approaches

- entanglement measures:

(real) functions on the state space, that

- are zero for states without entanglement (product states/separable states)
- are constant under local unitary operations
- do not increase under local operations and classical communication

**Problem:** a single entanglement measure implies a total order on quantum states, but the structure of multi-particle states is complicated

- local orbits:

Given two quantum states

$$|\psi\rangle \text{ and } |\phi\rangle \quad (\rho \text{ and } \rho')$$

on  $n$  particles (qudits), is there a local unitary transformation  $U = U_1 \otimes U_2 \otimes \dots \otimes U_n$  with

$$U|\psi\rangle = |\phi\rangle \quad (U\rho U^{-1} = \rho')?$$

# Our Approach

Use the polynomial invariants of the groups

- $SU(d) \otimes \dots \otimes SU(d)$
- $U(d) \otimes \dots \otimes U(d)$

operating on

- pure states  $|\psi\rangle$
- mixed states  $\rho$

to describe multi-particle entanglement.

This gives a *complete* description:

### **Theorem 3:**

The orbits of a compact linear group acting in a real vector space are separated by the (polynomial) invariants.

(A. L. Onishchik, *Lie groups and algebraic groups*, Springer, 1990, Ch. 3, §4)

# Operation of $GL(N, \mathbb{F})$

## Linear operation

on polynomials  $f \in \mathbb{F}[x_1, \dots, x_N] =: \mathbb{F}[\mathbf{x}]$

$$f(\mathbf{x})^g := f(\mathbf{x}^g) \quad \text{where } \mathbf{x}^g = (x_1, \dots, x_N) \cdot g \text{ and } g \in GL(N, \mathbb{F})$$

$\implies$  pure quantum states

## Operation by conjugation

on polynomials  $f \in \mathbb{F}[x_{11}, \dots, x_{NN}] =: \mathbb{F}[X]$

$$f(X)^g := f(X^g) \quad \text{where}$$

$$X^g = g^{-1} \cdot \begin{pmatrix} x_{11} & \cdots & x_{1N} \\ \vdots & \ddots & \vdots \\ x_{N1} & \cdots & x_{NN} \end{pmatrix} \cdot g$$

$\implies$  mixed quantum states

# Polynomial Invariants

## Basic problem

Given a subgroup  $G \leq GL(N, \mathbb{F})$ , which polynomials in  $N$  (or  $N^2$ ) variables are invariant under linear operation (or operation by conjugation)?

Notation:

$$\mathbb{F}[x]^G := \{f(x) \in \mathbb{F}[x] \mid \forall g \in G : f(x)^g = f(x)\}$$

## Properties of $\mathbb{F}[x]^G$

- Homogeneous polynomials remain homogeneous ( $\Rightarrow$  homogeneous generators).
- Any linear combination of invariants is an invariant.
- The product of invariants is an invariant.
- For reductive groups  $\mathbb{F}[x]^G$  is finitely generated.
- Some invariants are algebraically independent (primary invariants).
- The other invariants obey some polynomial relations.
- In special cases: the invariant ring can be decomposed as a free module (generated by the secondary invariants) over the primary invariants.

## Example: Invariants of $S_4$

$$S_4 = \left\langle \begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{pmatrix}, \begin{pmatrix} 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \right\rangle \cong \langle (1\ 2\ 3\ 4), (1\ 2) \rangle$$

### Power sums

$$p_1 := x_1 + x_2 + x_3 + x_4$$

$$p_2 := x_1^2 + x_2^2 + x_3^2 + x_4^2$$

$$p_3 := x_1^3 + x_2^3 + x_3^3 + x_4^3$$

$$p_4 := x_1^4 + x_2^4 + x_3^4 + x_4^4$$

### Elementary symmetric polynomials

$$s_1 := x_1 + x_2 + x_3 + x_4$$

$$s_2 := x_1x_2 + x_1x_3 + x_1x_4 + x_2x_3 + x_2x_4 + x_3x_4$$

$$s_3 := x_1x_2x_3 + x_1x_2x_4 + x_1x_3x_4 + x_2x_3x_4$$

$$s_4 := x_1x_2x_3x_4$$

Any polynomial invariant of  $S_4$  can be expressed uniquely as a polynomial in  $p_1$ ,  $p_2$ ,  $p_3$ , and  $p_4$  (or  $s_1$ ,  $s_2$ ,  $s_3$ , and  $s_4$ ).

## Example: Invariants of $Z_4 \leq S_4$

$$Z_4 \cong \langle (1\ 2\ 3\ 4) \rangle$$

Elementary symmetric polynomials:

$$s_1 := x_1 + x_2 + x_3 + x_4$$

$$s_2 := x_1x_2 + x_1x_3 + x_1x_4 + x_2x_3 + x_2x_4 + x_3x_4$$

$$s_3 := x_1x_2x_3 + x_1x_2x_4 + x_1x_3x_4 + x_2x_3x_4$$

$$s_4 := x_1x_2x_3x_4$$

and additional invariants:

$$f_1 := x_1x_2 + x_2x_3 + x_3x_4 + x_4x_1$$

$$f_2 := x_1x_2^2 + x_2x_3^2 + x_3x_4^2 + x_4x_1^2$$

$$f_3 := x_1x_2^3 + x_2x_3^3 + x_3x_4^3 + x_4x_1^3$$

Relations:

$$f_1^3 = 2s_2f_1^2 + (4s_4 - s_1s_3 - s_2^2)f_1 + s_1s_2s_3 - s_1^2s_4 - s_3^2$$

$$f_2^2 = (s_1f_1 - 2s_3)f_2 - f_1^3 + (4s_2 - s_1^2)f_1^2 + (s_1^2s_2 + s_1s_3 - 4s_2^2)f_1 + 4s_1s_2s_3 - s_1^3s_3 - 5s_3^2$$

$$f_3^2 = p_1(s_1, s_2, s_3, s_4, f_1)f_3 + p_0(s_1, s_2, s_3, s_4, f_1)$$

## Example: Invariants of $Z_4 \leq S_4$ (continued)

None of the invariants  $f_1$ ,  $f_2$ , and  $f_3$  is redundant:

	(1 3 4 2)		(2 4)		(1 4)(2 3)	
$x_1$	-1	$\alpha$	-1	-1	3	6
$x_2$	$\alpha$	$-2\alpha^2 - 4\alpha - 1$	1	2	-2	1
$x_3$	1	-1	3	3	1	-2
$x_4$	$-2\alpha^2 - 4\alpha - 1$	1	2	1	6	3
$s_1$	$-2\alpha^2 - 3\alpha - 1$	$-2\alpha^2 - 3\alpha - 1$	5	5	8	8
$s_2$	$2\alpha^2 + 3\alpha$	$2\alpha^2 + 3\alpha$	5	5	7	7
$s_3$	$2\alpha^2 + 3\alpha + 1$	$2\alpha^2 + 3\alpha + 1$	-5	-5	-36	-36
$s_4$	$-2\alpha^2 - 3\alpha - 1$	$-2\alpha^2 - 3\alpha - 1$	-6	-6	-36	-36
$f_1$	<b>0</b>	$4\alpha^2 + 8\alpha + 1$	6	6	16	16
$f_2$	$-3\alpha^2 - 5\alpha - 2$	$-3\alpha^2 - 5\alpha - 2$	<b>22</b>	<b>18</b>	100	100
$f_3$	$3\alpha^2 + 5\alpha + 1/2$	$3\alpha^2 + 5\alpha + 1/2$	48	48	<b>352</b>	<b>592</b>

(where  $\alpha^3 + 3\alpha^2 + 2\alpha + 1/2 = 0$ )

## Invariants for “Generic States”

(see e. g. N. Linden, S. Popescu, and A. Sudbery, PRL 83, 243–247 (1999), quant-ph/9801076)

- express the state  $\rho$  in terms of a local basis:

$$\rho = \frac{1}{D} I \otimes \dots \otimes I + \sum_{r=1}^n \alpha_{i_r}^{(r)} I \otimes \dots \otimes T_{i_r}^{(r)} \otimes \dots \otimes I + \dots + R_{i_1 \dots i_n} T_{i_1}^{(1)} \otimes \dots \otimes T_{i_n}^{(n)}$$

- investigate the infinitesimal action of  $SU(d_1) \otimes \dots \otimes SU(d_n)$  on  $\rho$   
     $\implies$  invariants are solutions of the PDE given by the resulting vector field  
        (Cayley's omega-process<sup>a</sup>)
- “generic states”:  
    maximal linear independent vector fields ( $\hat{=}$  algebraically independent invariants)  
     $\implies$  e. g., invariants that depend only on  $\alpha_i^{(r)}$  and the tensor  $R$
- this does not apply to all states, e. g., for QECC  $\alpha_i^{(r)} = 0$ .

---

<sup>a</sup>see e. g. B. Sturmfels, Algorithms in Invariant Theory, Springer, 1993

## “Generic Invariants”: Two Qubits

$$\rho = \frac{1}{4}I \otimes I + \sum_{j=x,y,z} \alpha_j^{(1)} \sigma_j \otimes I + \sum_{k=x,y,z} \alpha_k^{(2)} I \otimes \sigma_k + \sum_{j,k=x,y,z} \beta_{j,k} \sigma_j \otimes \sigma_k$$

Generic invariants (see, e. g., S. Lomonaco, “An Entangled Tale of Quantum Entanglement” )

$Tr(\beta\beta^t)$	$Tr((\beta\beta^t)^2)$	$\det(\beta)$
$(\alpha^{(1)}, \alpha^{(1)})$	$(\alpha^{(1)}\beta, \alpha^{(1)}\beta)$	$(\alpha^{(1)}\beta\beta^t, \alpha^{(1)}\beta\beta^t)$
$\alpha^{(1)}\beta\alpha^{(2)}$	$\alpha^{(1)}\beta\beta^t\beta\alpha^{(2)}$	$\alpha^{(1)}(\beta\beta^t)^2\beta\alpha^{(2)}$

⇒ for almost all states, these are algebraically independent invariants

additional invariant:

$$(\alpha^{(1)}, \alpha^{(1)}\beta\beta^t \times \alpha^{(1)}(\beta\beta^t)^2)$$

“to fix the signs”

## Non-Generic States

Consider the states

$$\rho := \frac{1}{256} \begin{pmatrix} 66 & 0 & 32 - 4i & 1 \\ 0 & 62 & 3 & 32 - 4i \\ 32 + 4i & 3 & 66 & 0 \\ 1 & 32 + 4i & 0 & 62 \end{pmatrix} \quad \rho' := \frac{1}{256} \begin{pmatrix} 66 & 0 & 32 + 4i & 1 \\ 0 & 62 & 3 & 32 + 4i \\ 32 - 4i & 3 & 66 & 0 \\ 1 & 32 - 4i & 0 & 62 \end{pmatrix}$$

$$\rho = \frac{1}{4}I \otimes I + \frac{1}{8}\sigma_x \otimes I + \frac{1}{64}\sigma_y \otimes I + \frac{1}{128}I \otimes \sigma_z + \frac{1}{128}\sigma_x \otimes \sigma_x + \frac{1}{256}\sigma_y \otimes \sigma_y$$

$$\rho' = \frac{1}{4}I \otimes I + \frac{1}{8}\sigma_x \otimes I - \frac{1}{64}\sigma_y \otimes I + \frac{1}{128}I \otimes \sigma_z + \frac{1}{128}\sigma_x \otimes \sigma_x + \frac{1}{256}\sigma_y \otimes \sigma_y$$

$$\alpha^{(1)} = \left(\frac{1}{8}, \pm\frac{1}{64}, 0\right), \quad \alpha^{(2)} = \left(0, 0, \frac{1}{128}\right)^t, \quad \beta := \frac{1}{256} \begin{pmatrix} 2 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

⇒ the values of the previous invariants are equal for  $\rho$  and  $\rho'$ , but  $\rho \not\cong \rho'$

# Invariant Tensors

(Y. Makhlin, quant-ph/0002045 and private communication)

- use local basis for the density matrix:

$$\rho = \frac{1}{4}I + \sum_{i=x,y,z} s_i \sigma_i \otimes I + \sum_{j=x,y,z} p_j I \otimes \sigma_j + \sum_{i,j=x,y,z} \beta_{ij} \sigma_i \otimes \sigma_j$$

- $SU(2) \otimes SU(2)$  acts as  $SO(3) \times SO(3)$  on the coefficient vectors  $s$ ,  $p$  and the coefficient matrix  $\beta$
- contract copies of the coefficient tensors with tensors that are invariant under  $SO(3)$  resp.  $SO(3) \times SO(3)$

$$\begin{array}{ll} \delta_{ij} & \text{inner product} \\ \epsilon_{ijk} & \text{determinant} \end{array} \quad \begin{array}{c} \text{---} \\ \diagup \quad \diagdown \end{array}$$

- create all possible contractions modulo the relations of the tensors

for two qubits, there is only a finite number of such contractions

⇒ complete set of invariants, resp. a set of generators for all invariants  
("fundamental invariants")

# Fundamental Invariants (I)

$$\text{Tr}(\beta\beta^t) = \begin{array}{c} \beta \\ \beta \end{array}$$

$$s^t s = s - s$$

$$p p^t = p - p$$

$$\det \beta = \begin{array}{c} \beta \\ \beta \\ \beta \end{array}$$

$$s^t \beta p = s - \beta - p$$

$$\begin{array}{c} \beta \\ \beta \\ \beta \\ \beta \end{array}$$

$$s - \begin{array}{c} \beta \\ \beta \end{array} - p$$

$$s - \begin{array}{c} \beta \\ \beta \end{array}$$

$$\begin{array}{c} \beta - p \\ \beta - p \end{array}$$

$$s - \begin{array}{c} \beta \\ \beta \\ \beta - p \end{array}$$

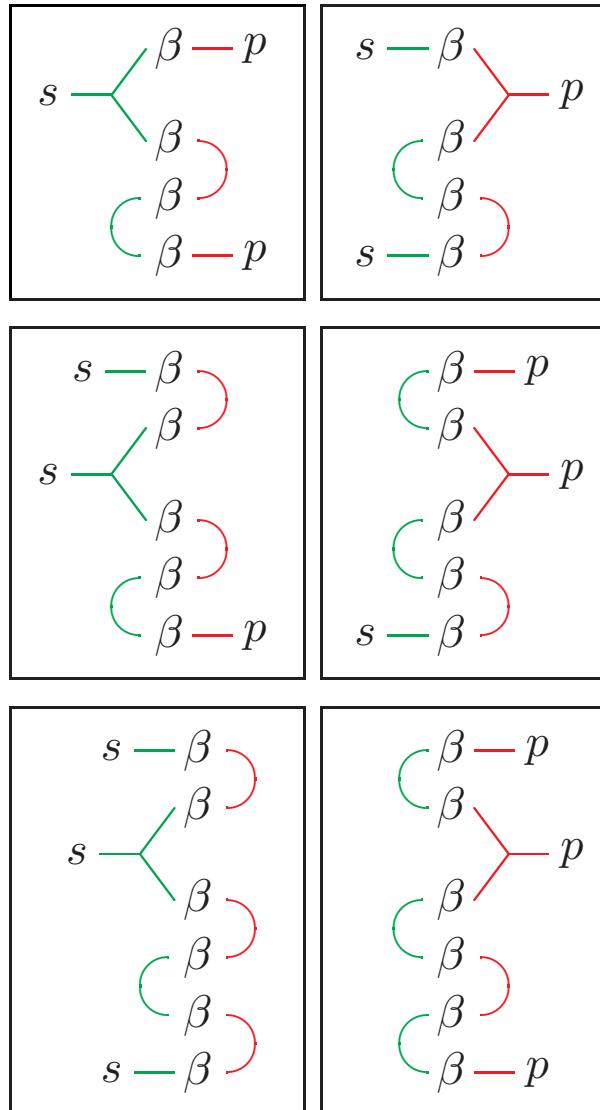

$$\begin{array}{c} s - \beta \\ \beta \\ \beta \\ \beta \end{array}$$

$$\begin{array}{c} \beta - p \\ \beta \\ \beta \\ \beta - p \end{array}$$

$$s - \begin{array}{c} \beta - p \\ \beta \\ \beta \end{array}$$

$$s - \begin{array}{c} \beta \\ \beta \\ \beta - p \end{array}$$

## Fundamental Invariants (II)

# Reynolds Operator

finite groups

$$\begin{aligned} R_G : \quad \mathbb{F}[x] &\rightarrow \mathbb{F}[x]^G \\ f(x) &\mapsto \frac{1}{|G|} \sum_{g \in G} f(x)^g \end{aligned}$$

$R_G$  is a linear projection operator

⇒ compute  $R_G(m)$  for all monomials  $m \in \mathbb{F}[x]$  of degree  $d = 1, 2, \dots$

compact groups

$$\begin{aligned} R_G : \quad \mathbb{F}[x] &\rightarrow \mathbb{F}[x]^G \\ f(x) &\mapsto \int_{g \in G} f(x)^g d\mu_G(g) \end{aligned}$$

where  $\mu_G(g)$  is the normalized Haar measure of  $G$

Problem computing the integral is very difficult

# Invariant Polynomials and Commuting Matrices (I)

Every homogeneous polynomial  $f(X) \in \mathbb{F}[x_{11}, \dots, x_{NN}]$  of degree  $k$  can be expressed as

$$f_F(X) := \text{Tr}(F \cdot X^{\otimes k}) \quad \text{where } F \in \mathbb{F}^{kN \times kN}$$

(since  $X^{\otimes k}$  contains all monomials of degree  $k$ ).

Example ( $N = 2, k = 2$ ):

$$X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix}$$
$$X^{\otimes 2} = \begin{pmatrix} x_{11}^2 & x_{11}x_{12} & x_{12}x_{11} & x_{12}^2 \\ x_{11}x_{21} & x_{11}x_{22} & x_{12}x_{21} & x_{12}x_{22} \\ x_{21}x_{11} & x_{21}x_{12} & x_{22}x_{11} & x_{22}x_{12} \\ x_{21}^2 & x_{21}x_{22} & x_{22}x_{21} & x_{22}^2 \end{pmatrix}$$

## Invariant Polynomials and Commuting Matrices (II)

$$\begin{aligned} f_F(X)^g &= \text{Tr}(F \cdot (g^{-1} \cdot X \cdot g)^{\otimes k}) \\ &= \text{Tr}(F \cdot (g^{-1})^{\otimes k} \cdot X^{\otimes k} \cdot g^{\otimes k}) \\ &= \text{Tr}(g^{\otimes k} \cdot F \cdot (g^{-1})^{\otimes k} \cdot X^{\otimes k}) \\ &= \text{Tr}(F^{(g^{-1})^{\otimes k}} \cdot X^{\otimes k}) \end{aligned}$$

$$f_F(X)^g = f_F(X) \iff f_F(X) = f_{F'}(X) \quad \text{and} \quad F' \cdot g^{\otimes k} = g^{\otimes k} \cdot F'$$

transformed question

Which matrices commute with each  $g^{\otimes k}$  for  $g \in G$ ?

R. Brauer (1937):

The algebra  $\mathcal{A}_{n,k}$  of matrices that commute with each  $U^{\otimes k}$  for  $U \in U(n)$  is generated by a certain representation of  $S_k$ .

# One Particle

- Hilbert space  $\mathcal{H}$  of dimension  $n$

- $G = U(n)$

- representation of  $S_k$ :

$S_k$  operates on a tensor product of  $k$  Hilbert spaces  $\mathcal{H}_i$  of dimension  $n$  by permuting the spaces:

$$T_{n,k}(\pi) \cdot (\mathcal{H}_1 \otimes \dots \otimes \mathcal{H}_k) = \mathcal{H}_{\pi(1)} \otimes \dots \otimes \mathcal{H}_{\pi(k)}$$

- “permuting  $k$  copies of  $\mathcal{H}$ ”

# **$N$ Particles**

- Hilbert space  $\mathcal{H} = \mathcal{H}_1 \otimes \dots \otimes \mathcal{H}_N$
- $G = U(n)^{\otimes N}$ ,  $g = U_1 \otimes \dots \otimes U_N$ ,  $g^{\otimes k} = (U_1 \otimes \dots \otimes U_N) \otimes \dots \otimes (U_1 \otimes \dots \otimes U_N)$
- $N$  permutations  $\pi_\nu \in S_k$
- representation of  $(S_k)^N$ :  
 $\pi = (\pi_1, \dots, \pi_N)$ ,  $\pi_\nu$  permutes the copies of the  $\nu^{\text{th}}$  particle:

$$T_{n,k}^{(N)}(\pi) \cdot ((\mathcal{H}_{1,1} \otimes \dots \otimes \mathcal{H}_{N,1}) \otimes \dots \otimes (\mathcal{H}_{1,k} \otimes \dots \otimes \mathcal{H}_{N,k})) = \\ (\mathcal{H}_{1,\pi_1(1)} \otimes \dots \otimes \mathcal{H}_{N,\pi_N(1)}) \otimes \dots \otimes (\mathcal{H}_{1,\pi_1(k)} \otimes \dots \otimes \mathcal{H}_{N,\pi_N(k)}))$$

# Computing Invariants

(see E. Rains, quant-ph/9704042<sup>a</sup>; Grassl et al. PRA 58, 1833-1839 (1998), quant-ph/9712040)

Computing the homogeneous polynomial invariants of degree  $k$  for an  $N$  particle system with density operator  $\rho$ :

for each  $N$  tuple  $\pi = (\pi_1, \dots, \pi_N)$  of permutations  $\pi_\nu \in S_k$  compute

$$f_{\pi_1, \dots, \pi_N}(\rho_{ij}) := \text{Tr} \left( T_{n,k}^{(N)}(\pi) \cdot \rho^{\otimes k} \right)$$

- all homogeneous polynomial invariant of degree  $k$
- in general,  $(k!)^N$  invariants to compute
- not necessarily distinct
- not linearly independent
- it is sufficient to consider certain tuples of permutations

---

<sup>a</sup>IEEE Transactions on Information Theory, vol. 46, no. 1, pp. 54–59 (2000)

## Molien Series

- Formal power series with non-negative integer coefficients
- Encodes the vector space dimension  $d_k$  of the homogeneous invariants of degree  $k$ :

$$M(z) := \sum_{k \geq 0} d_k z^k \in \mathbb{Z}[[z]].$$

- A rational function (for finitely generated algebras)
- General formula (for linear operation)

$$M(z) = \int_{g \in G} d\mu_G(g) \frac{1}{\det(id - z \cdot g)}$$

### Problems:

1. Applies only to the case of linear operation  
     $\Rightarrow$  “linearize” the operation by conjugation using the adjoint representation
2. Integral is very difficult to compute

# Pure States: Two Particles

Pure State

$$|\psi\rangle = \sum_{i=1}^{d^2} x_i |b_i\rangle \in \mathbb{C}^d \otimes \mathbb{C}^d$$

with a (global) orthonormal basis  $|b_i\rangle$ .

Schmidt decomposition

$$|\psi\rangle = \sum_{j=1}^d \alpha_j |b_j^{(1)}\rangle |b_j^{(2)}\rangle$$

with local orthonormal bases  $|b_j^{(1)}\rangle$ , and  $|b_j^{(2)}\rangle$ .

Invariants The (real) coefficients  $\alpha_j$  are the local invariants.

Problem

The invariants  $\alpha_j$  are no polynomial function in the coefficients  $x_i$ , but  $\alpha_j$  are eigenvalues of  $\rho_i := \text{Tr}_i(|\psi\rangle\langle\psi|)$   
 $\implies$  Use the coefficients of the characteristic polynomial of  $\rho_i$  (elementary symmetric polynomials or power sums).

## Example: Two Qubits

Pure State

$$|\psi\rangle = x_{00}|00\rangle + x_{01}|01\rangle + x_{10}|10\rangle + x_{11}|11\rangle$$

Invariants

$$\text{Tr}(|\psi\rangle\langle\psi|) = x_{00}\bar{x}_{00} + x_{01}\bar{x}_{01} + x_{10}\bar{x}_{10} + x_{11}\bar{x}_{11}$$

$$\begin{aligned}\text{Tr}((\text{Tr}_i |\psi\rangle\langle\psi|)^2) &= x_{00}^2\bar{x}_{00}^2 + x_{01}^2\bar{x}_{01}^2 + x_{10}^2\bar{x}_{10}^2 + x_{11}^2\bar{x}_{11}^2 \\ &\quad + 2x_{00}x_{01}\bar{x}_{00}\bar{x}_{01} + 2x_{00}x_{10}\bar{x}_{00}\bar{x}_{10} + 2x_{00}x_{11}\bar{x}_{01}\bar{x}_{10} \\ &\quad + 2x_{01}x_{10}\bar{x}_{00}\bar{x}_{11} + 2x_{01}x_{11}\bar{x}_{01}\bar{x}_{11} + 2x_{10}x_{11}\bar{x}_{10}\bar{x}_{11}\end{aligned}$$

Problem

We have to introduce new variables which are the “complex conjugated variables”.

Note

Algebraically, the roots  $i$  and  $-i$  of  $f(x) = x^2 + 1$  cannot be distinguished.

# Generalized Molien Series

Bi-degree of polynomials  $f$  in variables  $x_i$  and  $\bar{x}_i$ :

$$(\deg_{x_1, \dots, x_n} f, \deg_{\bar{x}_1, \dots, \bar{x}_n} f)$$

$F$ -Series:<sup>a</sup>

- Formal power series with non-negative integer coefficients
- Encodes the vector space dimension  $d_{k,\ell}$  of the homogeneous invariants of bi-degree  $(k, \ell)$ :

$$F(z, \bar{z}) := \sum_{k, \ell \geq 0} d_{k,\ell} z^k \bar{z}^\ell \in \mathbb{Z}[[z, \bar{z}]].$$

- General formula (for linear operation)

$$F(z, \bar{z}) = \int_G d\mu_G(g) \frac{1}{\det(id - z \cdot g)} \frac{1}{\det(id - \bar{z} \cdot \bar{g})}$$

---

<sup>a</sup>Michael Forger, J. Math. Phys. 39, pp. 1107–1141 (1998)

## Three Qubits: Ansatz F-Series of $SU(2)^{\otimes 3}$

$$\begin{aligned} F(\bar{z}, z) &= \int_{U \in G} d\mu_G(U) \frac{1}{\det(id - z \cdot U)} \frac{1}{\det(id - \bar{z} \cdot U^t)} \\ &= \frac{1}{(2\pi i)^3} \oint_{\Gamma_v} \oint_{\Gamma_w} \oint_{\Gamma_x} \frac{(1-v^2)(1-w^2)(1-x^2)}{\prod_{a,b,c \in \{1,-1\}} (1 - z \cdot v^a w^b x^c) (1 - \bar{z} \cdot v^a w^b x^c)} \frac{dv}{v} \frac{dw}{w} \frac{dx}{x} \\ &\quad (G = SU(2)^{\otimes 3}, U = U_1 \otimes U_2 \otimes U_3, \Gamma = \text{complex unit circle}) \end{aligned}$$

Computation of the integral using the theorem of residues

- symbolic computation of singularities and residues
- data type: factored rational functions implemented in MAGMA  
(Maple fails: “object too large”)

## Three Qubits: $F$ - and $M$ -Series of $SU(2)^{\otimes 3}$

$$\begin{aligned}
 F(z, \bar{z}) &= \frac{z^5\bar{z}^5 + z^3\bar{z}^3 + z^2\bar{z}^2 + 1}{(1 - z\bar{z})(1 - z^4)(1 - \bar{z}^4)(1 - z^2\bar{z}^2)^2(1 - z\bar{z}^3)(1 - z^3\bar{z})} \\
 &= 1 + z\bar{z} + z^4 + z^3\bar{z} + 4z^2\bar{z}^2 + z\bar{z}^3 + \bar{z}^4 + z^5\bar{z} + z^4\bar{z}^2 + 5z^3\bar{z}^3 + z^2\bar{z}^4 + z\bar{z}^5 \\
 &\quad + z^8 + z^7\bar{z} + 5z^6\bar{z}^2 + 5z^5\bar{z}^3 + 12z^4\bar{z}^4 + 5z^3\bar{z}^5 + 5z^2\bar{z}^6 + z\bar{z}^7 + \bar{z}^8 \\

# Three Qubits: Invariant Ring of $U(2)^{\otimes 3}$

Generators of the invariant ring:

	degree	permutations $(\pi_1, \pi_2, \pi_3)$	#terms
$f_1$	2	$(id, id, id)$	8
$f_2$	4	$((1, 2), (1, 2), id)$	36
$f_3$	4	$((1, 2), id, (1, 2))$	36
$f_4$	4	$(id, (1, 2), (1, 2))$	36
$f_5$	6	$((1, 2), (2, 3), (1, 3))$	176
$f_6$	8	$s_1 \bar{s}_1$	144
$f_7$	12	$\bar{s}_1 s_2^2$	5988

$f_1, \dots, f_6$  are algebraic independent. Relation for  $f_7$ :

$$f_7^2 + c_1(f_1, \dots, f_6)f_7 + c_0(f_1, \dots, f_6) \quad \text{where } c_0, c_1 \in \mathbb{Q}[f_1, \dots, f_6].$$

# Four Qubits: Ansatz $F$ -Series of $SU(2)^{\otimes 4}$

$$\begin{aligned}
F(\bar{z}, z) &= \int_{U \in G} d\mu_G(U) \frac{1}{\det(id - z \cdot U)} \frac{1}{\det(id - \bar{z} \cdot U^t)} \\
&= \alpha \oint_{\Gamma_u} \oint_{\Gamma_v} \oint_{\Gamma_w} \oint_{\Gamma_x} \frac{(1-u^2)(1-v^2)(1-w^2)(1-x^2)}{\prod_{\substack{a,b,c,d \in \{1,-1\}}} (1-z \cdot u^a v^b w^c x^d) (1-\bar{z} \cdot u^a v^b w^c x^d)} \frac{du}{u} \frac{dv}{v} \frac{dw}{w} \frac{dx}{x} \\
&= \left( (z^{36}\bar{z}^{36} - z^{35}\bar{z}^{33} + 2z^{34}\bar{z}^{34} + 6z^{34}\bar{z}^{32} + 9z^{34}\bar{z}^{30} + 4z^{34}\bar{z}^{28} + 3z^{34}\bar{z}^{26} - z^{33}\bar{z}^{35} + 7z^{33}\bar{z}^{33} + \right. \\
&\quad \left. 12z^{33}\bar{z}^{31} + \dots + 12z^3\bar{z}^5 + 7z^3\bar{z}^3 - z^3\bar{z} + 3z^2\bar{z}^{10} + 4z^2\bar{z}^8 + 9z^2\bar{z}^6 + 6z^2\bar{z}^4 + 2z^2\bar{z}^2 - z\bar{z}^3 + 1) \right) / \\
&\quad ((1-\bar{z}^6)(1-\bar{z}^4)(1-\bar{z}^4)(1-\bar{z}^2)(1-z^6)(1-z^4)(1-z^4)(1-z^2)(1-z^3\bar{z}^3)(1-z^2\bar{z}^2)^4 \\
&\quad (1-z\bar{z})(1-z^5\bar{z})(1-z^3\bar{z})^3(1-z^4\bar{z}^2)(1-\bar{z}^5z)(1-\bar{z}^3z)^3(1-\bar{z}^4z^2)) \\
&= 1 + z^2 + z\bar{z} + \bar{z}^2 + 3z^4 + 3z^3\bar{z} + 8z^2\bar{z}^2 + 3z\bar{z}^3 + 3\bar{z}^4 + 4z^6 + 6z^5\bar{z} + 19z^4\bar{z}^2 + 20z^3\bar{z}^3 + 19z^2\bar{z}^4 + 6z\bar{z}^5 \\
&\quad + 4\bar{z}^6 + 7z^8 + 11z^7\bar{z} + 47z^6\bar{z}^2 + 62z^5\bar{z}^3 + 98z^4\bar{z}^4 + 62z^3\bar{z}^5 + 47z^2\bar{z}^6 + 11z\bar{z}^7 + 7\bar{z}^8 + 9z^{10} + 18z^9\bar{z} \\
&\quad + 81z^8\bar{z}^2 + 150z^7\bar{z}^3 + 278z^6\bar{z}^4 + 293z^5\bar{z}^5 + 278z^4\bar{z}^6 + 150z^3\bar{z}^7 + 81z^2\bar{z}^8 + 18z\bar{z}^9 + 9\bar{z}^{10} + 14z^{12} \\
&\quad + 27z^{11}\bar{z} + 143z^{10}\bar{z}^2 + 299z^9\bar{z}^3 + 669z^8\bar{z}^4 + 900z^7\bar{z}^5 + 1128z^6\bar{z}^6 + 900z^5\bar{z}^7 + 669z^4\bar{z}^8 \\
&\quad + 299z^3\bar{z}^9 + 143z^2\bar{z}^{10} + 27z\bar{z}^{11} + 14\bar{z}^{12} + \dots
\end{aligned}$$

## Four Qubits: Molien Series of $U(2)^{\otimes 4}$

$$\begin{aligned}
 M(z) &= (z^{76} + 6z^{70} + 46z^{68} + 110z^{66} + 344z^{64} + 844z^{62} + 2154z^{60} + 4606z^{58} + 9397z^{56} + 16848z^{54} \\
 &\quad + 28747z^{52} + 44580z^{50} + 65366z^{48} + 88036z^{46} + 111909z^{44} + 131368z^{42} + 145676z^{40} \\
 &\quad + 149860z^{38} + 145676z^{36} + 131368z^{34} + 111909z^{32} + 88036z^{30} + 65366z^{28} + 44580z^{26} \\
 &\quad + 28747z^{24} + 16848z^{22} + 9397z^{20} + 4606z^{18} + 2154z^{16} + 844z^{14} + 344z^{12} + 110z^{10} + 46z^8 \\
 &\quad + 6z^6 + 1) / ((1 - z^{10})(1 - z^8)^4(1 - z^6)^6(1 - z^4)^7(1 - z^2)) \\
 &= 1 + z^2 + 8z^4 + 20z^6 + 98z^8 + 293z^{10} + 1\ 128z^{12} + 3\ 409z^{14} + 10\ 846z^{16} + 30\ 480z^{18} \\
 &\quad + 84\ 652z^{20} + 217\ 677z^{22} + 544\ 312z^{24} + 1\ 289\ 225z^{26} + 2\ 961\ 626z^{28} + 6\ 528\ 284z^{30} \\
 &\quad + 13\ 980\ 717z^{32} + 28\ 963\ 980z^{34} + 58\ 464\ 510z^{36} + 114\ 806\ 429z^{38} + \dots
 \end{aligned}$$

intermediate results:

1 invariant of degree 2	}	these 109 invariants generate a (sub)ring with series $1 + z^2 + 8z^4 + 20z^6 + 98z^8 + 221z^{10} + \dots$
7 invariants of degree 4		
12 invariants of degree 6		
50 invariants of degree 8		
39 invariants of degree 10		

⇒ even more invariants are required to generate the whole invariant ring

## “Homework”

Given: pure states  $|\psi\rangle, |\phi\rangle \in (\mathbb{C}^2)^{\otimes 4}$  of four qubits such that

$$\text{for all } 1 \leq i < j \leq 4: \text{Tr}_{i,j}(|\psi\rangle\langle\psi|) \cong \text{Tr}_{i,j}(|\phi\rangle\langle\phi|), \quad (1)$$

i. e., all reduced two-party density matrices are locally equivalent

Problem: Are the states  $|\psi\rangle$  and  $|\phi\rangle$  locally equivalent?

Related Work:

- N. Linden, and W. K. Wootters, “High order correlations of generic pure states of finite-dimensional quantum systems are determined by lower order correlations”, quant-ph/0208093
- N. Linden, S. Popescu, and W. K. Wootters, “The power of reduced quantum states”, quant-ph/0207109

but: these results hold only for generic states

⇒ Find states  $|\psi\rangle$  and  $|\phi\rangle$  for which (1) holds, but the states are not locally equivalent, or proof that such states do not exist.

## Some Open Problems

- Find a complete set of polynomial invariants for many particles and arbitrary dimension (e. g. using relations for tensors of higher rank).
- Investigate the structure of those invariant rings, e. g. via the Molien series.
- How many invariants are needed to separate the orbits in general?  
Y. Makhlin has shown that a proper subset of the invariants of two qubits is sufficient to separate the orbits under local operations.
- Combine polynomial invariants with semi-algebraic conditions (e. g. a density matrix has non-negative eigenvalues)
- Find a “physical” interpretation of the invariants.
- Find alternative characterizations, e. g.,
  - using the spectral decomposition of a state
  - normal forms for states
  - using representatives for each orbit
